2. TUJUAN PRAKTIKUM

1. Dapat memahami dasar-dasar pemrograman website menggunakan HTML, CSS, dan PHP.
2. Mengimplementasikan struktur data dan array.
3. Menerapkan struktur *looping* dan percabangan dalam menampilkan data.
4. Mengatur layout dan gaya visual halaman web.

3. PENJELASAN KODE PROGRAM

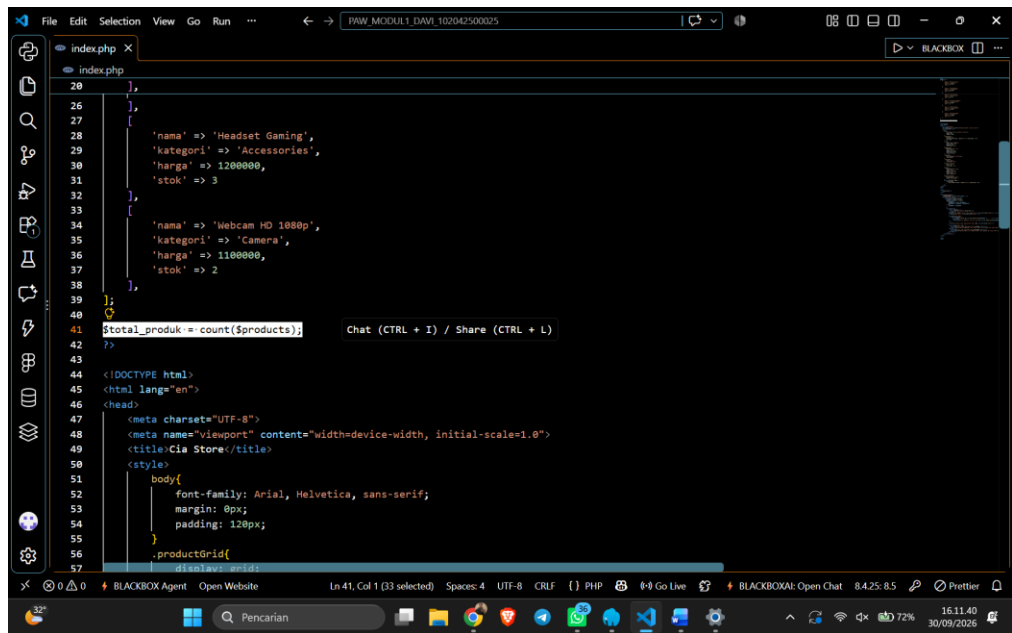

1. Di kode ini gunanya biar data kita rapi dan tersimpan di PHP, jadi kita ga perlu ngetik satu-satu barangnya di HTML.

A screenshot of a code editor window titled 'index.php X'. The editor shows PHP code defining an array named '\$products'. The array contains five product entries, each with 'name', 'kategori', 'harga', and 'stok' fields. The products are: Monitor 24 Inch (Display, 1800000, 4), Laptop Gaming (computers, 8500000, 0), Mouse Wireless (Accessories, 250000, 15), Mechanical Keyboard (Accessories, 1200000, 0), and Headset Gaming (Accessories, 1200000, 3). The code is as follows:

```
1 <?php
2 $products = [
3     [
4         'name' => 'Monitor 24 Inch',
5         'kategori' => 'Display',
6         'harga' => 1800000,
7         'stok' => 4
8     ],
9     [
10        'name' => 'Laptop Gaming',
11        'kategori' => 'computers',
12        'harga' => 8500000,
13        'stok' => 0
14    ],
15    [
16        'name' => 'Mouse Wireless',
17        'kategori' => 'Accessories',
18        'harga' => 250000,
19        'stok' => 15
20    ],
21    [
22        'name' => 'Mechanical Keyboard',
23        'kategori' => 'Accessories',
24        'harga' => 1200000,
25        'stok' => 0
26    ],
27    [
28        'name' => 'Headset Gaming',
29        'kategori' => 'Accessories',
30        'harga' => 1200000,
31        'stok' => 3
32    ],
33 ]
```

The editor interface includes a sidebar with icons for Explorer, Search, Source Control, and Run and Debug. The status bar at the bottom shows 'Ln 110, Col 1', 'Spaces: 4', 'UTF-8', 'CRLF', 'PHP', and other settings. The taskbar at the very bottom shows the system clock as 15:56:43 on 30/09/2026.

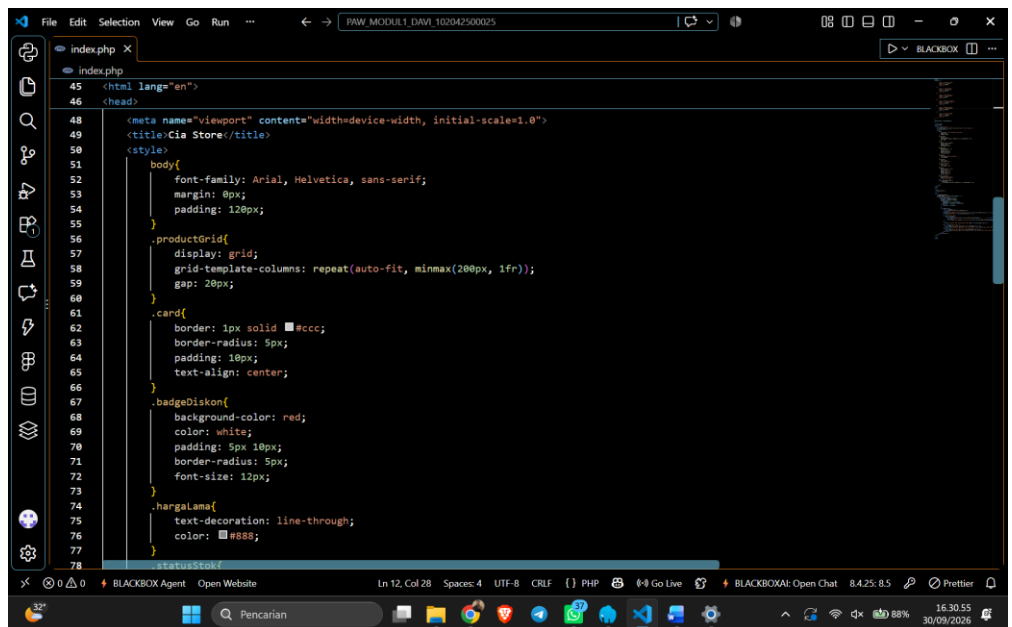

2. Gunanya biar jumlah total barang bisa ke ubah otomatis, kalo kita tambah atau hapus barang di array, angkanya bakal nyesuai in sendiri gaperlu kita ubah manual.

53 margin: 0px;
54 padding: 120px;
55 }
56 .productGrid{
57
```

3. Jadi gini

1. .productGrid: biar kotak produknya ke tata rapi menyamping otomatis
2. .card: itu style buat bikin bentuk kotak produknya.
3. .badgeDiskon sama .hargaLama: dipake buat bikin tabel diskon warna merah dan tulisan harga asli yang di coret.
4. @media (max-width: 600px): dipake biar tau kalo dibuka layar hp yang kecil, tampilan kolom bakal nyesuai in jadi gampang dilihat.

102 }

4. Jadi gini

1. Foreach: jadi kayak mesin perulangan. Dia bakal ngambilin data barang satu persatu dari array \$products buat di proses dan di tampilkan.
2. \$isDiscount: itu variabel buat cek contohnya itu “barang ini harganya 1jt atau lebih ga?”
3. Kalo nilai kodenya true, PHP langsung ngitung diskon 10% terus di potong harga asli. Kalo harga dibawah 1jt, ya harganya tetep normal.
4. Tag if (\$diskon): dipake biar label merah “Diskon 10%” Cuma muncul di barang yang harganya di atas 1jt.
5. echo \$item['kategori'] sama echo \$item['nama'] fungsinya buat nampilin teks kategori sama nama barang sesuai datanya.
6. Perintah number_format(\$hargaAwal, 0, ',', '.') ini penting banget buat ngubah angka mentah (misal 1800000) biar pas tampil di web ada titiknya dan berformat Rupiah (1.800.000). Terus kalau dapet diskon, harga lamanya bakal ditampilkan di atasnya dengan efek coretan.
7. Terus ada logika if buat dipake cek barang masih ada atau engga contohnya “kalo stok masih >0 bakal nampilin teks hijau tersedia yang bisa di klik, sedangkan kali <0 nanti teks bakal nampilin pesan stok habis lalu tombolnya berubah jadi abu-abu”
